Chapter 2

Basic Structures: Sets, Functions, Sequences, Sums, and Matrices

2.1 Sets and Functions

Definition 2.1.1.

- Fix an universal set U . Set operations: union \cup , intersection \cap , complement \bar{A} .
- Set inclusion: $A \subseteq B$ iff for all $a \in A$ it holds $a \in B$.
 $A = B$ iff $A \subseteq B$ and $B \subseteq A$.
- Given a set S , the power set of S is the set of all subsets of the set S . The power set is denoted by $\mathcal{P}(S)$, or 2^S .
- The Cartesian product of sets A_1, A_2, \dots, A_n is defined by:
 $A_1 \times \dots \times A_n := \{(a_1, \dots, a_n) \mid a_i \in A_i \text{ for } i = 1, \dots, n\}$.
- The cardinality of finite set A , denoted by $|A|$, is the number of its elements. The principle of inclusion-exclusion:

$$|A \cup B| = |A| + |B| - |A \cap B|$$

| TABLE 1 Set Identities. | |
|--|---------------------|
| <i>Identity</i> | <i>Name</i> |
| $A \cap U = A$ $A \cup \emptyset = A$ | Identity laws |
| $A \cup U = U$ $A \cap \emptyset = \emptyset$ | Domination laws |
| $A \cup A = A$ $A \cap A = A$ | Idempotent laws |
| $\overline{\overline{A}} = A$ | Complementation law |
| $A \cup B = B \cup A$ $A \cap B = B \cap A$ | Commutative laws |
| $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$ $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$ | Distributive laws |
| $\overline{A \cap B} = \overline{A} \cup \overline{B}$ $\overline{A \cup B} = \overline{A} \cap \overline{B}$ | De Morgan's laws |
| $A \cup (A \cap B) = A$ $A \cap (A \cup B) = A$ | Absorption laws |
| $A \cup \overline{A} = U$ $A \cap \overline{A} = \emptyset$ | Complement laws |

Definition 2.1.2. Let A and B be nonempty sets. A function $f: A \rightarrow B$ from A to B is an assignment of exactly one element of B to each element of A . We write $f(a) = b$ if $b \in B$ is assigned by f to the element $a \in A$. We say that

- A is the domain of f ,
- B is the codomain of f .
- If $f(a) = b$, we say that b is the image of a and a is a preimage of b .
- The range, or image, of f is the set of all images of elements of A .

Definition 2.1.3. Let A and B be two sets. The function $f: A \rightarrow B$ is called

- one-to-one, or an injection, if and only if $f(a) = f(b)$ implies that $a = b$ for all a and b in the domain of f .
- onto, or a surjection, if and only if for every element $b \in B$ there is an element $a \in A$ with $f(a) = b$.
- one-to-one correspondence, or a bijection, if it is both one-to-one and onto.

Definition 2.1.4. Let A , B , and C be three sets.

- Let $f: A \rightarrow B$ be bijective. The inverse function of f , denoted by f^{-1} , is the function that assigns to an element $b \in B$ the unique element $a \in A$ such that $f(a) = b$.
- Let $g: A \rightarrow B$ and let $f: B \rightarrow C$. The composition of the functions f and g , denoted $f \circ g$, is defined by

$$(f \circ g)(a) = f(g(a))$$

Definition 2.1.5 (Some Notations). Let A and B be two sets.

- For a function $f: A \rightarrow B$, and a set $D \subseteq A$, we use $f|_D: D \rightarrow B$ to denote the function f with domain restricted to the set D .
- A partial function f from a set A to a set B is an assignment to each element $a \in D \subseteq A$, called the domain of definition of f , of a unique element $b \in B$. We say that f is undefined for elements in $A \setminus D$. When $D = A$, we say that f is a total function.

Definition 2.1.6. Consider the set $U = 2^{AP}$ of all assignments. The semantic bracket is a function $\llbracket \cdot \rrbracket: PL \rightarrow 2^U$ defined by:

- $\llbracket p \rrbracket = \{\sigma \in U \mid p \in \sigma\}$,
- $\llbracket \neg\varphi \rrbracket = \overline{\llbracket \varphi \rrbracket}$,
- $\llbracket \varphi \rightarrow \psi \rrbracket = \overline{\llbracket \varphi \rrbracket} \cup \llbracket \psi \rrbracket$.

Is $\llbracket \cdot \rrbracket$ injective, surjective, or bijective?

2.2 Cardinality, Diagonalization Argument

Definition 2.2.1. Let A and B be two sets.

- The sets A and B have the same cardinality if and only if there is a one-to-one correspondence from A to B . When A and B have the same cardinality, we write $|A| = |B|$.
- If there is a one-to-one function from A to B , the cardinality of A is less than or the same as the cardinality of B and we write $|A| \leq |B|$. Moreover, when $|A| \leq |B|$ and A and B have different cardinality, we say that the cardinality of A is less than the cardinality of B and we write $|A| < |B|$.

Definition 2.2.2. A set that is either finite or has the same cardinality as the set of positive integers is called *countable*. A set that is not countable is called *uncountable*. When an infinite set S is countable, we denote the cardinality of S by \aleph_0 . We write $|S| = \aleph_0$ and say that S has cardinality *aleph null*.

Theorem 2.2.3 (SCHRÖDER-BERNSTEIN THEOREM). If A and B are sets with $|A| \leq |B|$ and $|B| \leq |A|$, then $|A| = |B|$.

Lemma 2.2.4. Prove that

1. The union, intersection of countable sets is countable.
2. The set \mathbb{N}^2 is countable.
3. The set \mathbb{Z} of integer numbers is countable.
4. The set \mathbb{Q} of rational numbers is countable.
5. The set \mathbb{N}^c with $c \in \mathbb{N}$ is countable.
6. The countable union of countable sets is countable.
7. The set \mathbb{N}^* is countable.

Lemma 2.2.5. Prove that

1. $|[0, 1]| = |(0, 1]| = |[0, 1)| = |(0, 1)|$.
2. $|(0, 1]| = |[1, \infty)|$.
3. $|[0, 1]| = |[0, k]| = |[0, \infty)| = |\mathbb{R}|$.
4. $|\{0, 1\}^\omega| = |[0, 1]|$.
5. $|2^{\mathbb{N}}| = |\{0, 1\}^\omega|$.
6. $|2^{\mathbb{N}}| = |\{ f \mid f: \mathbb{N} \rightarrow \{0, 1\} \}|$.

Lemma 2.2.6 (Cantor diagonalization argument).

- *The set \mathbb{R} of real numbers is uncountable.*
- *For a set A , it holds: $|A| < |2^A|$.*
